JavaFoil is a complete 3D computer aided design (CAD) software package for aerodynamic designers, research and development engineers, wind tunnel modelers, experimentalists and researchers who need to study and analyze airfoils. JavaFoil is an unique solution that helps you design, visualize, analyze, simulate and create mathematical aerodynamic models, wind tunnel models and surface equations, conduct analysis on, test and validate, as well as perform structural analyses of any type of airfoil, as well as all the aerodynamic parameters of an aircraft. Key Features: The software is designed for both students and professional engineers to quickly and easily design, analyze and analyze complex airfoils without the need for 3D computer graphics. JavaFoil allows you to create a mathematical representation of all types of airfoils, generate the flow field and surface solution and even plot the pressure fields. It includes a vast database of airfoils you can use for your analyses. JavaFoil allows you to extract data from the program and export to various file formats. JavaFoil is used by engineers to help them design, analyze, simulate and create mathematical aerodynamic models, wind tunnel models and surface equations. Key Benefits: The design process is as easy as 1-2-3 and the option of using the included airfoils is unlimited. The only tool you will need to create the model is a Microsoft Excel spreadsheet. So you can quickly learn how to design, simulate and analyze airfoils with JavaFoil. The modeling process is self-explanatory and without the need for advanced training. JavaFoil is so versatile that it enables you to create mathematical, structural and wind tunnel models for any type of airfoil You can design, analyze and test any airfoil and export data to a variety of file formats. JavaFoil Airfoil Editor - JavaFoil Airfoil Editor - Description The JavaFoil Airfoil Editor creates advanced airfoils from user-specified geometry. The airfoil editor window is divided into three major sections: 1)

Geometry - Define any number of shape items and annotate them with the desired shape. You can determine the number of points that will be used to approximate the airfoil. 2) Properties - Adjust the properties of the airfoil, including the Auto-Adjust, the Pressure Distribution algorithm, the Boundary Layer algorithm, the airfoil rotation, the trailing edge gap (0.0 to any positive number), and the flap rotation (0.0 to any number). The airfoil-related parameters can be modified directly on the numeric window. 3) Advanced Options - Determine the parameters used in the Pressure Distribution equation, including the boundary layer thickness, the trailing edge gap, and the flap rotation.
